RESEARCH INTERESTS

1. **Self-supervised Anomaly Detection:** Showed that the alignment between augmentation and anomalies is the key to the success of self-supervised learning for anomaly detection [arXiv-22a].
2. **Machine Learning on Graphs:** Designed inference-based approaches for node classification on edge-attributed graphs [ICDM-17], cold-start inductive learning [IJCAI-19], PU learning [ICDM-21], and missing feature estimation [KDD-22]. Proposed a way to modify the structure of a real-world graph for tractable inference [WSDM-20] or graph classification [WWW-22]. Improved the accuracy, interpretability, and robustness of graph neural networks via linearization [arXiv-22b].
3. **Multivariate time Series Forecasting:** Learned the relationships between time series variables by spatial attention [SDM-21]. Focused on the financial domain by utilizing data-axis Transformer [KDD-21] or self-supervised learning on sparse and noisy tweets [BigData-22].
4. **Interpretable ML:** Improved the learning capacity and interpretability of tree models by fusion with deep learning [ICDM-19, PAKDD-21]. Proposed a unified representation of deep tree models [SDM-22]. Understood the function of a deep neural network without data [NeurIPS-19].
